

Dear Sirs,

I use .NET (C#, VB.Net, ADO.Net, ASP.Net) since 2004, predominantly as a supporting skill for things like:

- CLR-Integration (Creation of .NET Assemblies containing Stored Procedures, Functions, Triggers und Data-types created in a NET-Language)
- Creation of SSRS-Extensions (for Data Processing, Delivery, Rendering and Security)
- Creating custom reports in Visual Studio
- When writing ADO.NET code for data access
- Integrating SSRS reports into Windows- or Web applications
- Script tasks and script components in SSIS developments
- Utilities for data upload/download from/to data providers like market index providers, benchmark providers (Bloomberg, JP Morgan, Reuters etc.)
- Online data exchange interfaces for connecting to 3rd party data sources like credit rating companies, location services providers etc.
- Creating ASP.Net and WPF-based UI for things like data entry and (ETL-)process control UIs

Kind Regards

Erdöl BIRAMEN
